

System implementation

When implementing any new system there are a number of things to consider, including [system requirements](#) and the actual implementation process. Whether you are [installing Totara](#) from scratch, [upgrading from Moodle](#), or [upgrading from a previous version of Totara](#) (which may involve [server migration](#)) you will want to consider setting up a good [learning architecture](#).

It is also possible to implement [full text search](#) and you can read more about this in the [developer documentation](#).

In this section you can find out about configuring [server settings](#), [security settings](#) and functionality, [caching](#) settings, and [logging](#).

Additionally you can review the [admin tools](#) and [development tools](#) available to you as a Site Administrator.

In the [site backup](#) section you can find out how to ensure that you are able to restore your site from a backup if things go wrong.

You can also configure how [logging](#) functions on your site, enabling you to effectively keep track of what's happening on your site.
